

Group meeting 6 with Jesús

10/01/2024

We start the meeting showing the new design of our project, which Nikol explained. First up are the register, login and guest page. The guest page will involve more pictures of the site/application that we build when the application is done.

We still want to make an admin account for the owner of the house, which will have to have the ability to log in, and who can also view the complaints made by the students.

Debate during the meeting:

Should there be a possibility for having a complaint not be anonymous ? For example the student can click a checkbox.

The owner of the house will always be able to see who complained.

And this means there needs to be a specific place to view the complaints (for admin, and the public complaints for students)

Then, Tymofii showed the process of registering and logging in which is functional.

The main page design needs some more work, as well as the rule page. We will also be adding more rules.

We should make the password invisible when typing in the textbox (for all passwords on forms).

Debate during meeting:

Who can/is allowed to register and how will that be controlled? So that not any random person can create accounts on this application. There are a few options:

- The owner of the house would have control of who is registering
- Admin could allow only certain emails
- People register but then they have to be approved by admin

We then showed the task function which is not fully ready yet, as of right now it is possible to add a task (with a name and a deadline date) but we cannot assign it to a student yet.

Suggestion is to change the way the date is put in, because it isn't clear which divider symbols you can use. (examples of date options: 11-2, 23/01)

We also still need to finish the persistence in files.

And update the process report on git with our progress.

Next week we will have the final presentation make sure the presentation itself is good, make the application full screen and resizable so that it is attractive to the client.

It is good that we make the GUI design look nice instead of it being rather bland because then it will be more memorable.

We should emphasize the guest page in the presentation because it (most likely to be) a unique feature (that our competitors do not have) which will make the client choose our application.

A tip: keep looking at the project plan that was created at the start to view your plans, promises and due dates because you will be asked later to review and explain yourself, so it is better to start the habit of periodically looking back at it.

Because in the first meeting promises are made but they tend to be way too ambitious and then people backtrack later. Small changes are okay but if you deviate too much from the project plan there needs to be good documentation for how and why.

Another tip: it is a good idea to have regular (stand-up) meetings within the group to improve communication amongst the group members and stay on track with the planning.
